Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

ip.department.us@nxp.com

Office Action Summary

Application No.

10/524,968

Applicant(s)

DE GREEF ET AL.

Examiner

Dennis P. Joseph

Art Unit

2629

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on 19 September 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-11 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-11 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 17 February 2007 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
- Paper No(s)/Mail Date _____

- 4) ☐ Interview Summary (PTO-413)
- Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

1. This Office Action is responsive to amendments filed in application No. 10/524,968 on September 19, 2007. Claims 1-1 are pending and have been examined.

Claim Rejections – 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. **Claims 3-11** rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 3 recites therein, "the quantization means is a random-access memory." The term RAM refers to a memory which can be accessed for a value and the value is output accordingly. It is not possible or plausible that it performs the role of quantization, gamma correction, dequantization, sub-field generation, etc. Appropriate correction and/or clarification is required.

For purposes of examination, the limitations will be interpreted as RAM/LUT is used to assist in the quantization, gamma correction, dequantization, sub-field generations means as detailed in the specification.

Claim Rejections – 35 USC § 103

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 103(a) that forms the basis for the rejections under this section made in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

5. **Claims 1-3, 5 and 7** are rejected under 35 U.S.C. 103(a) as being unpatentable over **Van Dalfsen et al. (US 2001/0005186 A1)** in view of **Kwak et al. (6,166,781)**

Van Dalfsen teaches in Claim 1:

A video circuit for processing video signals which show images on a display panel with linear light transition ([0005]), comprising a gamma correction circuit ([0037]), a quantizer (Figure 3, quantizer 304, [0046]) and a sub-field generator circuit ([0001], Figure 3, 306 and Column 3, Table 1 shows the combinations), but

Van Dalfsen does not explicitly teach that the circuit is “wherein a coarse adjustment of the quantization is made in a first random-access memory and a fine adjustment of the quantization is made in a second random-access memory.” He does not teach of a two-stage adjustment process done with LUTs.

However, in the same field of endeavor, display driving methods, Kwak teaches and shows in Figure 7, “After step 106, multiplier 90 multiplies the second data read from second LUT 86 with the lower bits, and outputs the product to adder 88 (step 108). After step 108, adder 88 adds the first data from first LUT 84 to the output from multiplier 90, and outputs the sum to an output port OUT as digital corrected data.” (Kwak, Column 9, Lines 12-16) Figure 7 shows the first LUT 84 and the second LUT 86. 86 multiplies and makes a coarse adjustment and the 84 adds and makes a fine adjustment.

Therefore, it would have been obvious to a person with ordinary skill in the art at the time of the invention to integrate two stage adjustment process as taught by Kwak with Van Dalfsen’s display device by implementing the two LUTs to quantize the signal with the motivation that “RAM is typically more complicated and larger than ROM, making look up table size even more critical in programmable systems.” (Kwak, Column 1, Lines 65-67) This is important because “Larger look up tables make integration more difficult and increases system costs” (Kwak, Column 1, Lines 61-62) and it also reduces the depth and width of the LUT leading to less output error.

Van Dalfsen teaches in Claim 2:

A video circuit for processing video signals which display images on a display panel with linear light transition ([0005]), comprising a gamma correction circuit ([0037]), a quantizer (Figure 3, quantizer 304, [0046]) and a sub-field generation circuit ([0001], Figure 3, 306 and Column 3, Table 1 shows the combinations), but

Van Dalfsen does not explicitly teach that the circuit is “wherein most significant bits are quantized in a first random-access memory and least significant bits are quantized in a second random-access memory.”

However, in the same field of endeavor, display driving methods, Kwak teaches, “An N-bit digital signal is input via an input port IN. The first LUT 20 stores first data, and reads the stored data using U upper bits (i.e., most significant bits) of the N-bit digital input signal as an address.” (Column 5, Lines 3-6) Figure 2 shows the first LUT 20 and this is for the most significant bits., “Multiplier 24 multiplies the M-bit second data, (here, M is varied according to the allowable error) read from the second look up table 22, with the D lower bits (i.e., least significant bits) of the N-bit digital input signal, and outputs the product to adder 26. (Column 5, Lines 21-24) Figure 2 shows second LUT 22.

Therefore, it would have been obvious to a person with ordinary skill in the art at the time of the invention to integrate two stage bit process as taught by Kwak with Van Dalfsen’s display device by implementing the two LUTs to quantize the signal with the motivation that “RAM is typically

more complicated and larger than ROM, making look up table size even more critical in programmable systems.” (Kwak, Column 1, Lines 65-67) This is important because “Larger look up tables make integration more difficult and increases system costs” (Kwak, Column 1, Lines 61-62) and it also reduces the depth and width of the LUT leading to less output error.

Van Dalfsen teaches in Claim 3:

A video circuit for processing video signals which show images on a display panel with linear light transition ([0005]), comprising a gamma correction means ([0037]), a quantization means (Figure 3, quantizer 304, [0046]) and a sub-field generation means ([0001], Figure 3, 306 and Column 3, Table 1 shows the combinations), but

Van Dalfsen does not explicitly teach that the circuit is “wherein the quantization means is a random-access memory.”

However, in the same field of endeavor, display driving methods, Kwak teaches in Figures 2 and 7 to use LUTs (read as memory) to replace the quantizer to alter the properties of the signals. (Column 9, Lines 11-16 and Column 5, Lines 21-24).

Therefore, it would have been obvious to a person with ordinary skill in the art at the time of the invention to integrate the quantizer as a LUT as taught by Kwak with Van Dalfsen’s display device by replacing the quantizer with a LUT with the motivation that “Larger look up tables make integration more difficult and increases system costs. In addition, a programmable system

for gamma correction typically uses RAM such as SRAM or DRAM for the look up table, instead of ROM. However, RAM is typically more complicated and larger than ROM, making look up table size even more critical in programmable systems. (Kwak, Column 1, Lines 65-67) The LUT has physical advantages in terms of size and would useful to utilize as the quantization means.

As per Claim 5:

A video circuit (Van Dalfsen, [0005]) as claimed in claim 3, but

Van Dalfsen does not explicitly teach that the circuit is “wherein the random-access memory is said gamma correction means.”

However, in the same field of endeavor, display driving methods, Kwak teaches “A conventional gamma correction apparatus uses a look up table stored in a memory such as a RAM or ROM.” (Column 1, Lines 48-50). The RAM is used to assist in the process, to the point where it considered to be the gamma correction means.

Therefore, it would have been obvious to a person with ordinary skill in the art at the time of the invention to integrate the gamma correction circuit as a RAM as taught by Kwak with Van Dalfsen’s display device with the motivation that “Larger look up tables make integration more difficult and increases system costs. In addition, a programmable system for gamma correction typically uses RAM such as SRAM or DRAM for the look up table, instead of ROM. However,

RAM is typically more complicated and larger than ROM, making look up table size even more critical in programmable systems. (Column 1, Lines 65-67) The LUT has physical advantages in terms of size.

Van Dalfsen teaches in Claim 7:

A video circuit as claimed in claim 3, wherein the random-access memory is said sub-field generation means. (Figure 3, [0046], “The image display unit has a look up table 306 containing the available levels and specifying what combinations of the ten available sub-fields are to be used for the respective levels.” As interpreted, the random-access memory provides for subfield generation means.)

6. **Claims 4 and 6** rejected under 35 U.S.C. 103(a) as being unpatentable over **Van Dalfsen et al. (US 2001/0005186 A1)** and **Kwak et al. (6,166,781)** as applied to claim 3, above, and further in view of **Okada et al. (US 5,854,799)**

As per Claim 4:

A video circuit (Van Dalfsen, [0005]) as claimed in claim 3, but

Van Dalfsen and Kwak do not explicitly teach that the circuit is “wherein the random-access memory additionally performs dequantization”

However, in the same field of endeavor, display driving methods, Okada teaches “The dequantizer 107 performs dequantization on the variable-length decoded data based on quantization threshold values stored in a quantization table, stored in the second ROM 111, to attain DCT (Discrete Cosine Transform) coefficients. (Okada, Column 3, Lines 8-12). The memory provides for dequantization means.

Therefore, it would have been obvious to a person with ordinary skill in the art at the time of the invention to integrate the dequantizer as a memory as taught by Okada with Van Dalfsen’s display device by implementing the dequantizer after the gamma correction circuit and quantizer with the motivation that “Based upon the dequantized data, a direct current error detector checks macroblocks by macroblock to determine if an erroneous macroblock exists. Each slice of a picture is checked. If an erroneous macroblock is found, an error processing circuit replaces the erroneous macroblock with a corresponding macroblock from a preceding picture.” (Okada, Columns 3-4, Lines 66-4) By using the dequantizer, it can be determined if an error was made and can subsequently be removed.

Van Dalfsen and Okada teach in Claim 6:

A video circuit as claimed in claim 4, wherein an inverse gamma circuit is arranged downstream of the random access memory. (The quantizer will alter the signals determined from the gamma correction curve and the dequantizer as taught by Okada will adjust the signals in the quantizer.)

7. **Claims 8-12** rejected under 35 U.S.C. 103(a) as being unpatentable over **Van Dalfsen et al. (US 2001/0005186 A1)** and **Kwak et al. (6,166,781)** as applied to claim 3, above, and further in view of **Lengyel (US 6,614,428 B1)**

Van Dalfsen teaches in Claim 8:

A video circuit ([0005]) as claimed in claim 7, wherein sub-field generation ([0046]) values are applied to a filter ([0046], “error filter 312”) via a conversion means ([0046], “addressing unit 308. This unit controls the switching of the cell during the various sub-fields when displaying image.”), but

Van Dalfsen and Kwak do not explicitly teach that the circuit has a “dequantization means”

However, in the same field of endeavor, image display, Lengyel teaches “Dequantizer 222 reconstructs the basis coefficients and dequantizer 224 reconstructs the residual.” (Column 19, Lines 42-45) Dequantizer 222 is used to convert the altered signal back to the original form.

Therefore, it would have been obvious to a person with ordinary skill in the art at the time of the invention to integrate the dequantizer as taught by Lengyel with Van Dalfsen’s display device by implementing the dequantizer after the gamma correction circuit and quantizer with the motivation that “The residual in this case measures the distortion between the transformed base rigid body and the current mesh” (Column 9, Lines 62-64) and “The compressor quantizes and encodes the transformation parameters of the geometric transforms, the base mesh, and residuals.

To minimize the distortion of the reconstructed meshes in the decompressor, the compressor computes the residual using quantized/de-quantized transformation and base mesh parameters.” (Column 10, Lines 46-50) In order to minimize distortion, the quantized/de-quantized method is used to eliminate the residual.

Van Dalfsen teaches in Claim 9:

A video circuit ([0005]) as claimed in claim 8, wherein the filter applies values to an adder which is situated in an input area of a second signal which represents pixel values of a neighboring line. ([0046], “The difference between the two values, which is the error originating from the quantization, is fed to error filter 312. The output of the filter is added to the value of one or more following pixels, depending on the nature of the filter, by adder 314.” The output after the adder represents the pixel value of the neighboring pixel line.)

Van Dalfsen and Lengyel teach in Claim 10:

A video circuit ([0005]) as claimed in claim 7, wherein the sub-field generation means values are applied to the adder via a second conversion means (Van Dalfsen, [0046], “addressing unit 308. This unit controls the switching of the cell during the various sub-fields when displaying image.”) and a second dequantization means. (Lengyel, Column 19, Lines 42-45, The second dequantizer 224. The combination teaches to use the dequantization means.)

Van Dalfsen and Kwak teach in Claim 11:

A video circuit ([0005]) as claimed in claim 9, wherein pixel values of the neighboring line are quantized in a further quantization means and sub-fields are generated in a further sub-field generation means (A sub-field generator uses the most significant bits to determine the values in the next sub-field and these bits are quantized in the LUTs), wherein a further random access memory is said further quantization means and said further sub-field generation means. (The combination teaches to use the quantization and sub-field generation means.)

Response to Applicant's Arguments

8. Applicant's arguments considered, but are respectively not persuasive.

Applicant argues that Kwak performs gamma correction means and not quantization means. However, Kwak does indeed teach of coarse and fine adjustments as Applicant claims (Kwak, Column 9, Lines 12-16) and shows so in Figure 7. Also, the combination teaches to use the quantization means as taught by Van Dalfsen, so any deficiency in Kwak, if any, is overcome in the 103 rejection.

Conclusions

Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).
